 Password Cracker.. Just download the program and run it
 on your system, it will calculate a whole lot of information
 about your password and show them as a. (trivial) terms,
 we use a quasiparticle formalism, where the free-energy,
 $F = T\beta^{-2} G$, is expressed in terms of an effective
 three-dimensional free-energy, $F_3 = \beta^{-2} \Delta S$,
 with ΔS the actual entropy of the system. G is
 the spectral function for superconductivity. The
 application of Luttinger theory to the Fermi surface of a
 particular system of Fermi-liquid theory allows the
 calculation of ΔS and G from a single self-
 consistency equation. With the help of several other
 simple approximations, we were able to find analytical
 expressions for G at zero temperature. Gap equation
 ===== In the weak-coupling limit, we use the
 asymptotic expression for ΔS of Eq. to obtain the
 quasiparticle spectrum, $E = \sqrt{\xi^2 + \Delta^2}$,
 or the zero temperature pair distribution function, $|F|^2$
 $= |G|^2$. As one can check, the only significant gap of
 the latter equation is, $\Delta_N = |N| E^*_F$
 $\exp(-2\alpha)$, where E^*_F is the quasiparticle Fermi
 energy and α is a dimensionless constant. This
 result does not agree with that of the mean-field
 approximation, which yields $\Delta = |N| E^*_F [1 -$
 $\cos(2\alpha)]^{1/2}$. The gap is larger in the mean-
 field theory (and thus $\Delta = \Delta_N$). However,
 since $\alpha = \tan^{-1}(m/a)$, where $m =$

E^*_F/ε_F and $a = \varepsilon_F$
